Case Study

Community-based tourism ventures, benefits and challenges: Khama Rhino Sanctuary Trust, Central District, Botswana

Lesego S. Sebele

Harry Oppenheimer Research Centre, University of Botswana, P/Bag 365, Masa, Botswana

ABSTRACT

The impact of Community-Based Natural Resource Management (CBNRM) is seen by many as a 'win-win' situation with reference to natural resources conservation and the improvement of local communities' livelihoods. However, community engagements in CBNRM and tourism are elicited many views as far as natural resources utilization is concerned. Some affirm the importance of CBNRM; others question it, while others call for its improvement. The premise of this study is to investigate the benefits and challenges of community-based tourism in one community of Botswana. Results show that although some benefits have been identified, there remain many challenges for the Khama Rhino Sanctuary Trust (KRST). It is evident that for community-based tourism to bring more benefits for locals, more interaction is needed between them and the Trust management. Increased local involvement and participation will help to ensure that people are empowered and the conservation of natural resources takes place. This paper asserts that community-based ventures, if properly run and managed, can promote the conservation of natural resources and increase local benefits through participation in tourism activities.

1. Introduction

During the 1960s and 1970s, community development was introduced as an approach to rural development. It was made popular by the United Nations during the same period as many countries in the less developed world gained independence and were decolonized (Carley, 1993). The rationale behind community development was to educate and remove the stigma of charity and involve local people in decision-making (Carley, 1993). However, this approach was found to have flaws and in the late 1990s it was discovered that rural development was hindered by top-down approaches to development and hence the adoption of an approach that calls for more active involvement of locals in development issues. Aid agencies such as the United States Agency for International Development, World Bank and the United Nations started promoting community participation as early as the late 1960s and early 1970s. This approach was promoted to involve locals in decision-making programme implementation, sharing the benefits of development and evaluating the programmes (Carley, 1993).

Since the 1980s, tourism literature has called for the inclusion and involvement of local communities in tourism projects. As local residents are seen as a key resource in sustaining the product (Hardy, Beeton, & Pearson, 2002). Community participation is often regarded as one of the most essential tools, if tourism is to make a substantial contribution to the national development of a country (Lea, 1988).

According to the Khama Rhino Sanctuary Trust (KRST) management plan, community participation is a planned effort to influence community opinion through good character and responsible performance, based upon mutually satisfactory two-way communication (Greenbank & Associates, 1999). Tsoum (2000, p3) asserts that it is a tool whose aim is to readjust the balance of power and to reassert local community views against those of the developers or the local authority.

For some, community participation in tourism ensures that there is sustainability (Woodley, 1993), better opportunities for local people to gain benefits from tourism taking place in their locality, positive local attitudes and the conservation of local resources (Tsoum, 2006). Participation is emphasised at the local level to facilitate physical development, the inclusion of community wishes in tourism planning and development and to ensure economic returns from the industry (Murphy, 1985).

Moreover, more emphasis is placed on issues of sustainability, social equity and environmental responsibility, thereby ensuring that development provides opportunities for people of different incomes and skills, promotes a better quality of life for all, and most importantly protects the environment (Roseland, 2005).

Local participation includes the empowerment and involvement of communities in decision-making, implementation, and identifying local problems (France, 1998) as well as introducing something that is adapted to local needs (Lea, 1988). Perhaps, the involvement of community can be seen as important due to the local knowledge that exists within communities, which can be of major importance in tourism development.

The increased participation of locals involves the inclusion of low-income people in both rural and urban areas, who are not normally involved in government processes (Lea, 1988). Citizen participation is regarded as something which is very essential and that should be encouraged because it makes the planning process more effective, equitable and legitimate, as long as those who participate are representative of the whole community and are capable of looking after collective interests as well as those of their own group (Huancos, Jentoft, Maurstad, Sand, & Karlsen, 2005). Ideally, community participation should lead to community economic development which can make citizens to shape their local economies by influencing the type of business, industry, and employment opportunities in their own backyards (Roseland, 2005, 163). It, therefore, involves designing development in a way that encourages intended beneficiaries to be at the forefront and participate in their own development, by mobilising their own resources, making their own decisions and defining their own needs and how to meet those (Steen, 1995). Furthermore, community participation is seen as a useful tool for educating locals about their rights, laws and political good sense, and, therefore, it is very important for public education (Tosin, 2003).

Overall, the participation of the local community is important in ensuring that visitors get an unforgettable, pleasant tourist experience, while at the same time enabling the community to derive benefits from their visits. Residents have the ability to provide helpful input in decision-making processes and, therefore, it is essential that they are actively involved in tourism planning and development (Murphy, 1995). The call for community participation is based on the assumption that participation lessens opposition to development, minimises negative impacts and revalues economies (Hardy et al., 2002).

The World Tourism Organization (1997) maintains that many countries rely on tourism because it generates revenue, creates employment and promotes private sector growth as well as infrastructure development. In Botswana, tourism is the second largest economic sector, after diamonds (Mbiawa, 2004, Mmopeliwa & Bigmau, 2000) and contributes 9.7% to the country’s GDP (World Travel and Tourism Council, 2007). It is also alluded that it is the second largest export sector after diamonds and provides employment for nearly 13 000 people in the country (Rabale, 2006).

The Botswana Tourism Policy places emphasis on the need for local communities to get a share of the profits made from the tourism sector (Government of Botswana, 1990). In addition, the Government of Botswana has a Community-Based Natural Resource Management (CBNRM) policy, which has recently been approved by parliament. According to Mbiawa (2004), CBNRM is regarded by the Government of Botswana as the country’s model of economics. The implementation of the programme was facilitated by the Wildlife Conservation Policy of 1986 and the Tourism Policy of 1993, both of which call for communities living in resource areas to participate in natural resource management and tourism development (Mbiawa, 2002). Estimates indicate that 47% of all households in the country cannot meet their basic needs, hence the need for rural development as a means for alleviating poverty and improving the livelihoods of rural communities, through income and employment generating activities (Government of Botswana, 2007).

The Khama Rhino Sanctuary Trust, which is at the centre of this study, is one Community-Based Organisation (CBO) of many in Botswana. It was set up to promote rural development in the country by involving communities in tourism and conservation activities.

The aim of this article is to determine the benefits and challenges of community-based tourism at KRTS and to add more insight and knowledge on existing literature on community-based initiatives. The study deals with an area in Botswana where tourism research is often overlooked, as more emphasis is placed on popular tourist attracting areas around the Okavango Delta. In the country, tourism research tends to focus on the major tourist attracting areas in the northern parks, especially the Okavango Delta. Although there is some literature on KRTS, it is very scanty and focuses mainly on wildlife conservation, and not on tourism.

The specific research objectives of this study are: (1) to determine the benefits and challenges of community-based tourism at KRTS and (2) to make suggestions on ways to address the identified shortcomings.

1.1. Community-Based Natural Resource Management (CBNRM)

This paper is informed by the concept of Community-Based Natural Resources Management approach, otherwise known as CBNRM in Botswana. The CBNRM programme evolved because of the quest to develop rural areas, involve local communities in development issues, and the conservation of natural resources, which most rural dwellers depend on. CBNRM has been the focus of many developing countries in recent years.

Although CBNRM was initially set up as a conservation approach, the rural development side of it has become more prominent (Aronzen, Sethigole, & Barnes, 2007). It is based on the common property management theory which discourages open access resource management; it, however, promotes resource ownership, control and use by local communities (Ribot & ancestor, 1995).

The CBNRM approach owes its roots to the Southern African region (Swart, 2005) and evolved as a regional effort, often through regional networks of key individuals (Child, 1995). It was started in the 1980s and its origins are often traced to Zimbabwe as it provided much of the early impetus to this movement (Child, 1995) when there was a realisation by natural resource managers that people living within and next to wildlife and protected areas can only conserve and use these natural resources in a sustainable manner, only when they can derive benefits from them (Swart, 2005). However, informal CBNRM initiatives were started in Zimbabwe and Namibia (Aronzen, Sethigole et al., 2007), the Communal Areas Management Program for Indigenous Resources (CAMPFIRE) which has become a model for other CBNRM programmes that have emerged throughout the region (Swart, 2005), formally made CBNRM a famous initiative (Aronzen, Sethigole et al., 2007). Zimbabwe is, therefore, regarded as the first pioneer of the CBNRM approach in Southern Africa, due to its famous CAMPFIRE projects. CBNRM then continued in Zambia (ADAMADE), Namibia (LTE program) and Botswana (NRM project) (Aronzen et al., 2003 as cited in Selebano, 2005).
Initially, CBINRM focused mainly on wildlife and its main impetus was to ensure that people living within areas rich in wildlife derive economic benefits more especially employment and income (Swatuk, 2003). However, CBINRM has since diversified to include other natural resources such as veld products (Gujadhur, 2000), mangroves, marine and coastal resources (Ruzema, 2000), resources conservation and improving livelihoods, craft production, sustainable use of natural resources, community-based tourism and environmental education for communities (Arntzen et al., 2003).

Other countries in the region which have adopted the CBINRM approach include Namibia, where communities can register with the government as conservancies and receive conditional use rights over wildlife (Ashley, 2000). In Malawi, CBINRM focuses on natural resources within protected areas and allows the consumptive use of resources by communities adjacent to national parks and Wildlife Reserves. The wildlife, however, remains the property of the state (Arntzen et al., 2003). In South Africa, natural resource management focuses on Parks and Protected Areas. The country, however, does not have a specific CBINRM approach; with each province adopting a different approach (Arntzen et al., 2003).

According to Arntzen, Setchigole et al. (2007), CBINRM projects have mushroomed in Southern Africa due to the lack of alternative development and conservation models as well as the stimulation of donor agencies and governments.

A CBINRM project can be defined as a 'project or activity where a community (one village or a group of villages) organize themselves in such a way that they derive benefits from the utilization of local natural resources and are actively involved in their use and conservation. Often (but not always), communities will receive exclusive rights and responsibilities from government (Arntzen et al., 2003, 12).

According to Sindinga (1999, 115), community-based conservation is a bottom-up approach to natural resource management and is a 'reverse of the long-held top-down conservation strategies which tended to be technocratic' and led to low local benefits and participation in conservation (www.cbinnr.bw).

The rationale behind CBINRM is that governments cannot successfully and efficiently protect natural resources outside protected areas, and, therefore, community resource management is a better development and conservation strategy (Arntzen et al., 2003, 25). Furthermore, local resource management encourages greater local participation, and the decentralization of benefits of wildlife use increase local benefits and stimulate communities' interest in resource conservation. The participation and cooperation of locals in tourism is much more important than in any other industry (Murphy, 1985, 153 as cited in Sindinga, 1999).

In Botswana, the CBINRM programme was officially started in 1999 and was initiated by the Botswana Government and the United States Agency for International Development (USAID), through a joint Natural Resource Management Project (NRMP) (Gujadhur, 2000; National CBINRM Forum, 2005). The programme was set up after the realisation that without the involvement of rural communities residing within and adjacent to designated conservation areas, the conservation of wildlife was not possible and sustainable. The assumption made was that once local communities fully participate and derive benefits they can develop a sense of ownership and will use their natural resources sustainably (Mhsawa, 2007). Furthermore, the government and donor agencies were concerned that the rural poor were exerting unsustainable pressure on their natural resources (Fabricius & Koch, 2004).

In Botswana, CBINRM is seen as a development approach that supports natural resource conservation and the alleviation of poverty through community empowerment and the management of resources for long-term social, economic and ecological benefits (Government of Botswana, 2003). It advances 'identified national engines of growth such as tourism, wildlife, forest and veld products that rely upon a healthy environment for profits' and is 'based on ideals of equality, natural resource conservation, and social development' (Government of Botswana, 2000, 1).

According to the National CBINRM Forum in Botswana, the CBINRM programme is guided by 10 principles:

- Decision-making authority must be at community level.
- Decision-making must be representative.
- The community must be as small as practical.
- Leadership must be accountable.
- Benefits must accrue to communities.
- Benefits must be distributed equitably.
- Benefits distribution must be linked to natural resources conservation.
- Planning and development must focus on capacity-building.
- Local development must be coordinated.
- The CBINRM process must be facilitated.

Source: National CBINRM Forum, 2005

The country is divided into 163 Controlled Hunting Areas (CHAs), each having a designated use, e.g., community multi-purpose use, commercial photographic use etc. CHAs are mostly zoned around existing villages and settlements. The use of natural resources in the CHAs has been devolved to Community-Based Organisations (CBOs) (Gujadhur, 2000), such as KREST. The CBINRM programme has been adopted across the whole country, with over 135,000 people being involved and over 1,100 villages participating in the programme (Arntzen, Buzwani et al., 2007; Arntzen, Setchigole et al., 2007). In Botswana, the majority of CBOs are located around the Okavango and Chobe/Zambezi rivers (Arntzen, Buzwani et al., 2007; Arntzen, Setchigole et al., 2007). Community participation is a very important component in the CBINRM programme.

12. Study area

Set up in 1992, KREST is a community-based organisation whose main aim is to save rhinos and to bring about economic benefits for locals through tourism and the sustainable use of the available natural resources (Sebele, 2005). It covers an area of approximately 4,300 hectares and as shown in Fig. 1 below, is located 25 km north of Serowe along the Serowe-Grpse road, 7 km east of Peje and about 11 km north-east of Mabepaedi (Gosman & Associates, n.d.; Sebele, 2005). The sanctuary is in the Central District of Botswana, the largest district in terms of area and population (Sebele, 2005).

KREST is an initiative of three villages of Serowe, Peje and Mabepaedi (Sebele, 2005). Serowe, the biggest village in the district, had a population of 42,444 people during the 2001 census. Peje had 2,085 and Mabepaedi had 1,780 during the same period (Botswana Central Statistics Office, 2002). The sanctuary is governed by a board of Trustees which has 10 members; 8 from Serowe, 1 from Peje and 1 from Mabepaedi (Sebele, 2005). The unique nature of the board membership is attributed to the disparities in the population sizes of the three villages.

KREST has a number of objectives. These include amongst others, to establish, develop and manage the Kahoma Rhino Sanctuary on behalf of the community; to protect the environment within the Sanctuary and to protect and maintain endangered rhinoceros and all other fauna and flora; to establish, maintain and preserve the biodiversity within the Sanctuary; to generate revenue for the local community from tourism and other uses of the Sanctuary’s renewable resources and to provide environmental education to
Besides rhinos, many other species of animals are found at KRST, some of which settled in the area naturally while others were translocated into the area. These include zebras, blue wildebeest, giraffes, elands, springboks, impalas, gemsbok, kudu, steenbok, duiker, red hartebeest, wartog, leopard, ostrich, African wild cat, caracal, small spotted genet, black-backed jackal, bat-eared fox and brown hyena. The Sanctuary is also home to over 130 bird species (http://www.khamarthisanctuary.com/about.html) (Fig. 1).

2. Methodology

This paper made use of results obtained from a study conducted between July 2004 and October 2004. The study made use of both primary and secondary sources.

Primary data collection techniques used included formal interviews with key stakeholders (chiefs, VDC chairpersons, local farmers and KRST board members), the administering of questionnaires (both structured and unstructured) and focus group discussions. Interviews were used to increase the response rate, ensure reliability in understanding the questions asked and to ensure that the researcher obtained the information needed. There were also used to determine the nature of community participation at KRST as well as to determine the social impacts of KRST. In addition, informal interviews were used to collect data from the Chief Warden at KRST. These informal interviews involved face discussions with the Warden to determine whether communities are effectively involved in the management of KRST.

A case study was used because it involves the detailed study of a few persons or items and, therefore, provides in-depth, detailed analysis (Coles and Barlow, 1981, 51–63). The case study of KRST, therefore, provides a clearer picture of benefits and problems faced by the community in running its tourism enterprise.

In terms of sampling, key decision makers were targeted. The following were interviewed: the chiefs of the three villages, the board members of KRST and the chairpersons of the Village Development Committee (VDC), a village level committee responsible for the development of the village in each of the three villages. Furthermore, two focus group discussions were also held in each of the three villages. These were held to determine the perceptions of locals on KRST and to ascertain the benefits and challenges offered by the venture. A focus group discussion is a tool for collecting data...
from group discussions and follows a predetermined interview guide to direct a discussion of about five to twelve people (Nielson, 1997). Each group comprised of 10 people. One group comprised of the youth whilst the other was made up of the elderly.

This method of data collection was chosen because it gives more insight on the way participants think, the perceptions and ideas of a group. It also allows for more in-depth views and comments to be given by respondents as opposed to individual questioning (as in a household sample where only the household head is interviewed). More unexpected views can also be given and explored (Nielson, 1997). This, however, does not mean that the method does not have disadvantages. The smallness of the group means that it may not be representative of the whole community and more outspoken individuals may dominate the discussions. However, it is one of the best methods to use when conducting qualitative research (Nielson, 1997).

Secondary sources used included journals, published books, unpublished reports and newsletters, government policy documents (CBNRM policy, Tourism policy etc.) as well as the Internet.

Data collected were then analyzed using descriptions and classification. According to Kitchin and Tate (2000), descriptions refer to the portrayal of data in a form that can be easily interpreted. For this study, this involved a written account of what came up during focus group discussions and interviews. Descriptions generate a more thorough and comprehensive description of the subject matter (Kitchin & Tate, 2000, 233). Classification on the other hand involves the breaking down of data into constituent parts and then placing them into similar categories or classes (Kitchin & Tate, 2000). For this research data was classified into responses given and categorized into themes.

3. Results

3.1. The benefits of community-based tourism

KRRST has several socio-economic benefits, these include the following:

3.1.1. Employment for local communities

Findings indicate that community-based tourism at KRRST has become a very important source of employment for local communities, with the Sanctuary employing locals in a variety of jobs ranging from cleaners, drivers, guides etc. Results from interviews with the Chief Warden indicate that KRRST employs 26 permanent staff members, with 23 coming from the 3 member villages of Somoro, Faje and Mabalekpadi and the remaining 3 coming from other parts of the country.

Furthermore, results indicate that casual labourers are occasionally hired when the need arises. This scenario is not only applicable to Botswana as findings in Kenya and Namibia show that casual earnings often match wage income and can, in principle benefit all residents and are significant for communities with less options for collective income (Ashley, 2000a, 4). Moreover, waged employment can lift a household’s living standards, and casual earnings, although very low, are more widely spread (Ashley, 2000a).

The creation of employment by KRRST is very important in promoting rural development in this rural community. Rural areas in developing countries are often characterised by a shortage of facilities and industries and are inhabited by the poorest people in the society; therefore, earnings from community-based tourism create an alternative means of survival for locals. CBNRM is, therefore, a means for reducing poverty in rural areas, through the provision of employment (both permanent and casual employment) for locals.

The Trust contributes to local economic development, with results indicating that people who are employed use their wages to assist family members financially, thereby improving their living conditions. Wages obtained from this CBNRM project are used for various activities, including the payment of school fees, the buying of food and clothing and the construction of traditional dwellings/huts. CBNRM has, therefore, become a livelihood strategy for rural dwellers, many of whom may not have had other alternatives in the rural areas. This is very important, especially in Botswana where unemployment is very high, especially in the rural areas and amongst women and the youth (van der Jagt, Gachweli, & van Bussel, 2000).

3.2. Local development

Results from the interview with the Village Development Committee (VDC) chairperson in Faje show that KRRST has assisted the needy within the community with funds obtained from the CBNRM project. In 2004, KRRST made a donation of P400,000 (around US $45) to the Faje VDC, to assist in the construction of a house for orphans in the village. This has been the only form of financial benefit the community has been able to get from KRRST so far. Although this is commendable, after twelve years in operation, this may not be enough, bearing in mind the goals of CBNRM (poverty alleviation and rural development). This is, however, a very important gesture as the number of orphans has increased considerably in Botswana in recent years. A number of factors can be attributed to this; chief amongst these is the escalating HIV/AIDS pandemic. This increase in the number of orphans puts a lot of pressure on the government to provide welfare services for surviving family members. An initiative such as KRRST is very important in lessening the pressure on the government as well as in promoting rural development by providing funds for community members in need.

Results from interviews with board members and the Chief Warden indicate that KRRST does not have a clear cut benefit distribution plan, which is very crucial for the success of the enterprise. A question may arise as to whether the Sanctuary distributes benefits to individuals, households or institutions (such as the VDC in this case). The lack of a benefits distribution plan may have harmful consequences and may affect the success and progress of KRRST and other CBNRM enterprises. For CBNRM enterprises to succeed, benefits from natural resource utilisation should outweigh the costs to ensure the sustainability of CBNRM projects. For example in Sanctuary village, in the Ngamiland District of Botswana, the Sanctuary Trust distributes funds made from CBNRM to each household in the village on an annual basis (Nhlabua, 2007). Thakale (2005) argues that although the distribution of benefits may differ in the types and mode of distribution, if benefits are felt at a household level, this may positively change people’s attitudes towards conservation.

Results indicate that there are other indirect benefits trickling down from the KRRST through rent for local house owners. Results also indicate that all workers from Somoro, re-located in Faje (as it is the village closest to KRRST) thereby generating income for the house owners. The involvement of the community in CBNRM has, therefore, helped in diversifying rural livelihoods and creating sustainable opportunities for locals.

3.2.3. Contribution to conservation and tourism

Unlike other CBNRM projects where natural resources are found within the locality, the rhinos at KRRST were not from the local area. Results from an interview held with the Chief Warden indicate that the sanctuary started with only four rhinos, which were translocated from the northern parts of Botswana in 1983; with the assistance of the Natal Parks Board (South Africa). In total 14 rhinos were translocated to the sanctuary between 1992 and 1999. Some
of the rhinos were donated by and transported from Port Elizabeth by the North West Parks Board (South Africa) in 1995 and in 1996. With assistance from South Africa, therefore, KRST has contributed significantly to the conservation of the species in the country (Chief Warden's Project Proposal, 2002; Sebele, 2005).

At the time of data collection, there were 56 rhinos in Botswana, with 27 of them being at KRST (personal communication with the Chief Warden). Rhinoceroses are an endangered species, in Botswana, with their numbers having been in decline for a long period of time in the country. The project has, therefore, been excellent in introducing the rhino species in an area where they did not exist before. The CENRM project is in this regard important for conserving the few remaining species in Botswana. However, the enterprise still has the potential to become a source of pride for locals through the inclusion of locals in the planning and development process. This is, however, hampered by the failure to deliver on promises made at inception, such as the building of schools, clinics and the distribution of benefits from profits made. Results through interviews with board members indicate the problems of the pulse (the local currency), however, unfulfilled promises may lead to the failure of the project if locals become disillusioned (Sebele, 2005).

Wildlife tourism is synonymous with the North West District of Botswana, especially the Okavango Delta. This form of tourism is still in its infancy in the Central District and KRST has expanded the District to its activities (Sebele, 2005). Moreover, focus group discussions with elders in the village indicate that parents now spend less money on school trips, as children no longer have to travel long distances to the popular Okavango Delta in the Ngami District (Sebele, 2005).

3.3.4. Sourcing of local goods and services

Focus group discussions as well as the interview with the Chief Warden indicate that community-based tourism (CBT) has enabled the sourcing of goods and services from the local community. Small, Medium and Micro Enterprises (SMMEs) as well as informal sector operators provide a number of services to the Sanctuary. These services include: welding, fencing, roofing, laundry, laundering, peaceful and funeral services. Furthermore, arts and crafts are obtained from a San project in a neighbouring village (although not part of KRST). The sourcing of locally available goods and services is very important for this community as opportunities are created for small-scale, informal sector operators, who otherwise would not have access to the main stream tourism industry, which is mostly foreign dominated.

The importance of small-scale tourism operators is not unique to Botswana. In the Gambia, a number of hotels source fresh fruit and vegetables from local groups of women; as it has been established that the sourcing of products and services such as food, drinks and furnishings has the potential to generate sustainable, long-term, reliable markets and so generate increased employment and improved local revenues (Bath Goodwin, 2003, 36). Entry into the tourism economy through the provision of goods and services, is one way in which locals in developing communities can sustain their livelihoods and help in the eradication of poverty.

The importance of small-scale tourism cannot be overly emphasized as according to Lester (2002), small-scale tourism brings more benefits to locals as it makes use of locally available materials and creates higher multiplier effects as most of the income generated is retained in the local economy.

3.3.5. Tourist numbers

Table 1 below shows that tourists' numbers to KRST have been increasing between the years 1996 and 2003; thereby implying an increase in the revenue generated over the years. However, although the numbers of tourists have been increasing steadily over time, benefits (in terms of financial benefits to community members and employment creation) to the community have not. The Chief Warden attributes this to amongst other things, high operational costs and a shortage of capital.

The Environmental Education Centre (EEC), opened in 2003, may be responsible for the increase in the number of visitors for that year. The EEC provides environmental education and hosts many school children, equipping them with knowledge on environmental and conservation issues.

Although the number of tourists to KRST has been increasing, the Ngamiland District, where the world famous Okavango Delta is located, remains the most attractive area in the country. In terms of tourist numbers and marketing campaigns, both the private and public sectors. However, attractions such as the KRST have been untapped and the potential for them to attract tourists are being realised.

4. Challenges of community-based tourism

Interviews and focus group discussions highlighted a number of challenges at KRST. These include: lack of tangible benefits and employment creation, the loss of benefits from the land, poor management, marketing and entrepreneurial skills, lack of community involvement and participation, no sense of ownership of the project amongst the community members and the heavy reliance on foreign donors.

4.2. Employment creation

Although figures from Table 1 indicate that the numbers of tourists have increased steadily over the years, results, however, indicate that the numbers of employees have remained the same. The Chief Warden attributes this to high operational costs and a rise in inflation levels. Results also indicate that all the money made by KRST is from tourism and its related activities, however, it can only cover operational costs and staff salaries. In addition to conserving rhinos, the project aims to provide economic benefits to the local community through tourism and the sustainable use of natural resources. The question that arises then is, is the KRST a sustainable project? If the project can only make enough to pay its workers it may lose the support of the community, which expects more benefits in terms of employment and some generating activities.

The community, however, does not have any information about this, with a majority even not having been to KRST on trusting access to information about the Sanctuary.

The interview with Ngami village chief revealed that KRST provides an avenue for locals to sell their produce at the main entrance; however, none have taken up this initiative. Studies in other countries, however, indicate that this is a very very important initiative for rural dwellers, as shown by some parks in KwaZulu Natal, South Africa and the Conondale National Park in Zimbabwe, where women craft sellers are given sites within the parks and for the latter, several local communities benefit from a market at the park entrance (Mabiyu & Van Zyl, 2002).

4.2.1. Lessons learnt

Focus group discussions with community members in the three villages indicate that residents are unhappy because they lost a number of valuable natural resources now found and located within KRST; the most important of which is their communal land. In this regard, the community believes that it has incurred more costs than benefits; therefore, costs outweigh benefits. Studies on CENRM (Mbiawa, 2004; Marpehe, 1999; Stone, 2006) have shown that the sustainability of projects whose costs outweigh benefits is
small as such projects have a higher risk of failure. This is because communities prefer to support projects with more socio-economic benefits than costs. From group discussions, it was revealed that the project has impoverished locals by taking away grazing land for their livestock, thereby reducing the production of poor quality live stock, which cannot fetch good prices on the market, making it difficult for community members to generate enough income to send their children to school.

Furthermore, locals also offer the opportunity to gather and sell wild fruits, shrubbery and roofing poles. In light of this, development which have taken place at KRI have had little or no benefits for the majority of locals. This loss is further exacerbated by what is perceived to be inadequate compensation for the losses (Sedebe, 2005). It can be deduced that the losses further enhance the circle of poverty and defeat the goal of community-based initiatives, which is to eradicate poverty in the rural areas.

Other losses identified by residents of Pje include the loss of access to firewood. Located in a rural area, inhabited by some of the poorest people in the society, many rely on these natural resources for their livelihood (Sedebe, 2005).

4.2.1. Poor management, marketing and entrepreneurial skills

The community-based initiative has been marred by poor managerial, entrepreneurial and marketing skills. Although the Trust has a website, at the time of data collection, it had neither been updated nor visited in two years. Results indicate that the lack of finance has made it difficult for the BTO to market itself internationally by exhibiting in international tourism trade fairs such as ITB Berlin. Currently, the tourism initiatives have also been made difficult to consistently attend national tourism fairs, like Tourism Indaba in Durban, South Africa. However, the BTO will be exhibiting its products at Indaba 2007.

4.2.3. Lack of community involvement and participation

All the respondents interviewed (elderly and youth group discussions, board members, village chiefs, VOC Chairperson and the Chief Warden) stated that the community is not involved in the running of KRI. Although, at the initial stages of the project consultations through Kgotla meetings were held to get the locals’ permission to use their tribal communal land, results indicate Kgotla meetings are only once in a year to give an annual report and every two years to elect board members. A Kgotla is a traditional meeting place for Botswana communities. This is a place where communities discuss issues that are of concern to them. It may also be used as a place where disputes, differences and conflicts within the community are discussed and settled. The Kgotal meeting is usually led by a Kgosi (chief) with the help of his advisors. This lack of interaction means the community’s voice is seldom heard. The implication is that decisions made may not represent the wishes of the community. However, two-way communication is essential for the successful running of community-based tourism ventures, such as KRI.

Interviews with board members indicate that in making decisions, the board does not involve the community. The reason given is that newsletters are produced quarterly and the Sanctuary office is open for everyone. However, the Sanctuary offices are located in Serowe; therefore, not everyone in the community has access to them. The locals, most of whom are very poor, may in most cases not afford to visit the offices. The 2002/2003 Household Income and Expenditure Survey data indicates that the proportion of people living below the poverty datum line fell from 47% in the 1990s to 30% in 2003 (Central Statistics Office, 2004). In 2003, the poverty rate in rural areas was estimated to be around 43% while in the urban areas it was estimated at around 15.3% (Thawale, 2007). It is evident from the above that poverty is more rampant in rural areas such as our case study. The 2006 United Nations Human Development Report estimates that during the 1990-2004 period, 23.4% of the population lived below US$1 per day. Furthermore, Botswana is ranked 51st out of 102 developing countries in terms of the human poverty index (http://www.undp.org/humdev/2006/00/hivpd_facts.pdf).

Newsletters produced by KRI are written in English and this further alienates those who are illiterate and do not understand English. Although the production of a newsletter is a welcome idea, only a minority of the community has access to it, while the majority is left out. If the main reason for producing the newsletters is to educate the community about the enterprise, it is essential that it is accessible to the majority and should be in a language they all understand. Perhaps, the newsletters should be printed in Setswana (national language of Botswana) and available at each of the village kgotlas, so that a majority of villagers have access to information. For illiterate locals, meetings at the kgotlas are also essential to ensure that they also have access to information about their enterprise.

Access to information and the participation of the community in tourism development is of utmost importance as it creates good rapport with those directly affected by the Sanctuary and helps the Sanctuary to plan with communities and not for communities. The lack of interaction further exacerbates the lack of information about KRI and also hampers community participation.

In addition to the lack of information, income generating activities by locals and the private sector are not encouraged by board members. Although the Sanctuary did not have a lodge or a restaurant, the board had rejected a proposal by a South African company to build one (Sedebe, 2005). Moreover, the local youth office in Serowe had also asked not been granted permission to run horse riding excursions for tourists at the Sanctuary although respondents support the tourism initiative; poorly informed decisions may hamper the progress of the project.

4.4. Lack of sense of communal ownership of the project

The question who owns KRI? elicited a number of responses, with some respondents stating that it is owned by the Kham family; it is a panacea; it used to be a community project but now it is owned by our family in Serowe. The Kham family is a very well known family in the history of Botswana and Serowe. They are the ruling family in Serowe (i.e. the paramount chief is a member of the family). The first president and the current president of Botswana
are members of the family. It is interesting to note that some farmers, who were relocated from the area to pave way for the development of the tourism venture, were amongst those who did not know the owner of the venture.

Community sense of ownership is very important as communities can only be active participants in tourism projects if they have a sense of ownership of those projects (Scheyvens, 2002). According to Germaine and Associates (n.d, 43), "The concept of ownership is not just a matter of pride for locals only if they have a sense of ownership of the project. Community-based tourism should be run in a transparent manner, be represented by its stakeholders to reflect the interests of the community and reflect true ownership" (Means, 2009, 31).

This lack of knowledge about KREST may be due to the dominance of a few individuals since the project inception. Discussions indicate that the view that KREST is community-based is not supported by some community members who believe the community name is just being used to solicit funds for the enterprise. The belief amongst some is that the enterprise continues to be dominated by individuals who are at the forefront of project inception. Locals believe they are being used, in reality, the elites are the ones controlling and deriving benefits from the enterprise. The issue of elite dominance has also been experienced in other African countries such as Zambia, where chiefs were put in charge of wildlife management sub-committees. Problems experienced included nepotism and projects being located in and around chiefdoms (Gibson & Marking, 1995).

Studies around the world indicate that "elites often dominate community-based development efforts and monopolize the benefits of tourism" (Scheyvens, 2002, 5). This may lead to situations where there is no sense of ownership of community-based projects amongst community members leading to the remotivation of tourism enterprises in the locality. The dominance by elites in this community coupled with the loss of livelihood resources may lead to the remotivation of the tourism project, ultimately leading to a decent in the conservation gains of the Sanctuary. For tourism to be sustainable and ecologically friendly, the participation of communities is essential in ensuring that locals accept tourism ventures (Wahab, 1997). Research indicates that people manage and conserve resources only when they perceive that the resources contribute positively to their quality of life and this in most cases happens when the resources contribute income and sustains people within a community (Dikobe & Thaladi, 1997).

This view is also supported by Walpole and Goodwin (2000, 527), who assert that the existence of local economic elites further constrains the distribution of benefits and at a village level, it is mostly those who benefit from ecotourism while at the national level, the central government gains more because it controls "rates and revenues from national parks." The assumption that communities can equitably share benefits from tourism, therefore, seems to be a highly romanticised but an almost impossible feat.

From all the adults interviewed, 86% had never been to KREST compared to only 25% of the youth. The remaining 75% of the youth had been to the Sanctuary on school tours. The non-visit by adults may be attributed to the lack of involvement, information, and participation, board membership has cut down to 2% of adults. It can be deduced then, that had it not been for their membership to the board, almost all adults would never have visited the Sanctuary.

The success of the venture is, however, dependent on the proactive participation of the community not only on their passive participation, as seems to be the case now. Using Pretty's (1995) typology of participation, we can deduce that the locals in this case study are passive participants. According to Scheyvens (2002), communities that are passive participants in tourism ventures receive low-paying jobs at a tourist resort, while having no control over the nature of development and no involvement whatsoever in the running of the tourism enterprise. This seems to be the case at KREST, where the community is not involved in any decision-making regarding the running of their supposedly owned enterprises.

The results, therefore, indicate that although paper the community is said to own the project, their participation is minimal, hence it can be argued that the project is not theirs. This is indicated by the fact that they do not know anything about it, they are not actively involved in the day-to-day decision-making and do not reap benefits from the venture. It is, therefore, important to note the people who are said to be the owners of the project do not know that. Furthermore, the dominance of certain individuals in the CBNRM project indicated the abuse of such projects by some elites who use the project for their own benefits. Hence the belief by some community members that the community name is just being used to solicit funds for a project owned by only a few elites in the community.

Although the CBNRM policy of Botswana advances the promotion of the conservation of natural resources, to increase local participation in tourism related activities and to improve rural livelihoods, the KREST case study indicates that this is not always achievable, as indicated by results from this project. With the KREST, local involvement and participation remain almost non-existent. In fact, results indicate that the majority of the community is left out with only a minority being at the forefront and possibly benefiting from the project. It is therefore essential to ensure that care is taken to ensure that the whole community decides on the activities they want at KREST and more importantly, how they want their benefits to be shared, distributed and used. The questions to ask them are how community-based is KREST and who own KREST?

The assumption that can be made then is that local involvement and participation has no meaning for this community as there is no control over the running and decision-making of the project they supposedly own and control. Development economists define participation by the poor in terms of the equitable distribution of benefits from a project (Paul, 1991), however, the KREST case study indicates that this is sometimes not achievable as there are certain sites within the community who manipulate and take control of resources which are meant for the benefit of all within communities.

4.1.5. Imbalance in local representation

With 30 members, one coming from Faje, 1 from Mabaleupadi and 8 from Serowe, KREST board membership is not representative. The Chief Warden attributes this imbalance to the differences in the population sizes of the three villages. However, in determining the figures, no ratio was used, this decision was made arbitrarily. Due to this imbalance, residents of Faje and Mabaleupadi state that Serowe residents have an unfair advantage over them and this may explain why most services are sought from Serowe. Through focus group discussions, residents highlighted that food, as well as petrol and diesel are bought from Serowe, while minor services such as welding, thatching grass and roofing poles are sought from Faje residents. Although locals acknowledge the importance of sourcing products from the community, there is a belief that Serowe villagers receive more from the enterprise than the other villages (Schele, 2005). The imbalance in representation may at a later stage create problems especially when used as a criterion for financial benefit distribution.

4.1.6. Reliance on donor funding

The Sanctuary gets most of its funds from donors including the African Development Foundation, Environmental Heritage Foundation of Botswana, European Development Fund, European Union and Global Environmental Facility (GEF), among others. Interviews with the Chief Warden at the Sanctuary revealed that
a restaurant was to be built with funds from African Development Corporation. This is a good development as the building of the restaurant, will most likely lead to an increase in the number of tourists and revenue generated. Furthermore, the opening of the restaurant may also lead to an increase in the number of permanent employees and casual labourers.

The over-reliance on external donors, however, makes the economical viability of the project questionable; can the project survive without the intervention of donor agencies? The over-reliance on donors creates a dependency syndrome which the Sanctuary may find difficult to get out of once the donors pull out. Organisations that depend heavily on foreign aid usually collapse in the end when aid agencies withdraw their assistance. Informal interviews with the Chief Wardens also revealed the Sanctuary does not only rely on assistance from these donor agencies only; for aerial counts of wildlife there is reliance on the Department of Wildlife and National Parks and the Botswana Defence Force for security and ensuring that poaching does not take place.

5. Conclusion

Globally, there has been a call in recent years to get communities involved in tourism to ensure that they benefit from their natural resources. This case study has shown that community-based tourism can improve the lives of rural people through the creation of employment; generating income through the renting of houses for workers at KRST and the sourcing of locally available goods and services.

However, the CBO has come across many challenges. Due to these challenges, some community members view KRST as a liability as the Sanctuary has not lived up to many community members' expectations. Instead of getting benefits, results reveal that some community members feel that the costs they have incurred far outweigh the benefits. This has led to a number of natural resources and the lack of benefits for a majority of community members were identified as a major obstacle hindering the progress of KRST.

The community, therefore, argues that although tourism is important, they have lost a number of benefits which were very essential for their livelihoods. CBNRM assumes that if locals have more control of their natural resources, they develop a sense of ownership and can conserve these resources. Results from this case study, however, indicate that benefits are limited, with only a few people being employed and only one village getting financial assistance for community development projects.

The lack of certain skills needed in the tourism industry also hampers the progress of projects such as KRST and, therefore, the community needs to acquire managerial, entrepreneurial and marketing skills to ensure that they break through into the market and in the process gain a bigger share of benefits from the tourism industry. Community-based ventures cannot succeed if locals do not acquire these skills as they are essential for the running of any successful business/enterprise. This situation does not only apply to KRST as research shows that, CBOs in Botswana experience problems due to poor management and administrative skills, poor financial management and control and inefficient project development and management expertise (CAR, 2003; Stone, 2006). The intention of CBNRM is to help people manage natural resources in such a way that plants, people and animals benefit; this can only be achieved once the community gains the required skills.

With regards to benefits, KRST has to develop a benefits distribution plan to be used in dispensing benefits from the enterprise. This is very important as it will outline the nature and manner in which the enterprise wishes to allocate benefits to the three villages involved. For example, with Zimbabwe's, CAMPFIRE projects, 80% of the money raised through various activities is given directly to the communities and collectively they decide what to do with the money. A total of 20% is retained by the district councils for administrative purposes as well as to manage local CAMPFIRE projects (Arntzen et al., 2003). Initial guidelines proposed 50% of wildlife revenue should be distributed to the communities, 35% be wildlife management and 15% for rural districts councils. (Gujadhur, 2000). In 1992, revised guidelines increased the community share to 80%. Results at KRST indicate that only a few individuals get benefits from the project, hence the aims of CBNRM may not be reached as benefits are not shared equally amongst members. Benefits should be for the whole community and not for a minority of individuals in the community, as is alleged at KRST.

CBNRM calls for the involvement of local communities in decision-making processes, on issues affecting their livelihoods. Results from this case study indicate that locals are rarely involved in decision-making processes. Research, however, indicates that the involvement and participation of local communities leads to local empowerment, a better quality of life for the community and allows communities to define their needs as well as the means to meet them (Lea, 1998; Rosedal, 2005; Stone, 1998). According to Stone (2006), a majority of CBOs in Botswana show deficiencies in the area of involving locals in decision-making; hence many face serious problems and are unable to inform their members about the challenges that they face. However, if a CBO is to be successful, locals have to be fully involved in its running from inception to the operation stage and in the day to day decisions making processes. If participation is minimal or non-existent, communities may not be compelled to use natural resources wisely.

This may be true for KRST where the community has no sense of ownership and only a few individuals benefit from the project. Unlike other CBNRM results for this case study indicate that unless drastic measures are taken to involve local communities, the project may not be a success story, in terms of improving the livelihoods of rural communities and introducing sustainable conservation measures.

A number of authors (Ashley & Roe, 2002; Ashley & Goodwin, 2001; Mahony & van Zyl, 2002; Schryvers, 2002) have alluded to the importance of community-based initiatives in improving the poor's access to assets which improve their livelihoods and develop their communities. In South Africa, some Makuleke community members have benefited through capacity-building and training programmes, thereby empowering them to take advantage of employment opportunities that may arise. More importantly, CBNRM has ensured that the community has access to its communal land which was taken away from them during apartheid years (Ashley & Roe, 2002). In Marinduque Island, Philippines, one Village Association runs a 'rural life tour' as part of an integrated marine resource management plan, whereby a fish sanctuary enables fish stocks to recover and also uses them for recreational purposes. Income is also generated from 'gitling' and 'sari-sari' store sales (Shah & Gupta, 2000).

This paper therefore supports the view that communities should be allowed to become active participants and decision makers, to allow for more benefits to accrue to the society. The researcher maintains that locals can only become active participants if they have support from the government, private sector and NGOs to enable the transfer of skills and knowledge. This can only be achieved through enabling policies and frameworks which maximise the full potential of local communities, while at the same time ensuring that the benefits of tourism outweigh the costs.
